Feedback Analysis Report

Project Name: Studli – Study Planner App
Project Title: Usability Testing and Iteration
Week: 3
Prepared by: Smriti
Testing Participants: 2

1. Introduction

Studli is a study planner application designed to help students organise their academic activities, manage study schedules and monitor their progress. The purpose of usability testing was to evaluate how easily users could understand and navigate the app.

Two participants were asked to interact with the Figma prototype and complete four common tasks. Their feedback was collected to identify which parts of the design worked well and which areas needed improvement.

The collected feedback was analysed and used to make improvements to the prototype. This process helped make Studli more understandable, user-friendly and consistent with students' needs.

Purpose of the Report

- Evaluate the usability and clarity of the Studli prototype.
- Understand users' experiences while completing common tasks.
- Identify design issues and areas that require improvement.
- Use participant feedback to make meaningful design changes.
- Review the improvements made to the prototype.

2. Usability Testing Method

Usability testing was conducted to understand how easily students could interact with the Studli application and use its main features. The testing was performed using the interactive Figma prototype.

Testing Details

- Testing Method: Prototype-based usability testing
- Number of Participants: 2
- Target Users: Students
- Platform: Figma
- Testing Type: Task-based usability testing

Participant Profiles

Participant 1 (P1)

- **Age:** 16
- **Gender:** Male
- **Occupation:** Student
- **Education Level:** 12th Grade
- **Technology Familiarity:** Intermediate
- **Needs/Goals:** Wants an easy way to organise study activities and manage academic tasks.
- **Testing Observation:** Found the Study Partner feature somewhat difficult to understand and suggested improving the visual layout.

Participant 2 (P2)

- **Age:** 20
- **Gender:** Female
- **Occupation:** Student
- **Education Level:** Undergraduate student
- **Technology Familiarity:** Intermediate
- **Needs/Goals:** Wants a convenient way to organise study activities and create new tasks.
- **Testing Observation:** Completed all four tasks easily and suggested adding an option to create new study tasks.

Test Scenarios

Each participant was asked to perform the following four tasks:

No.	Task	Purpose
1	Plan studies	Check whether users can organise their study activities.
2	Check progress	Evaluate how easily users can view their study progress.
3	Find a study partner	Check whether users understand and can access this feature.
4	Return to Home	Evaluate the navigation between screens.

Feedback Collection

After completing the tasks, participants were asked about their experience, including:

- Which screen they found easiest to use.
- Whether they experienced any confusion.
- What improvements they would suggest.

Their responses were recorded and compared to identify usability issues and opportunities for improvement.

Testing Approach

The participants interacted with the prototype independently. Their task completion and feedback were used to evaluate the clarity, navigation and overall usability of Studli.

3. Participant Feedback

Feedback was collected from two participants after they interacted with the Studli Figma prototype and completed four usability tasks.

- **Participant 1 (P1)**

Evaluation Area	Feedback
Plan studies	Easy
Check progress	Easy
Find study partner	Some difficulty
Return to Home	Easy
Easiest screen	Planner
Confusion	Nothing
Suggestion	Improve the design because it looks a little congested.

- **Participant 2 (P2)**

Evaluation Area	Feedback
Plan studies	Easy
Check progress	Easy
Find study partner	Easy
Return to Home	Easy
Easiest screen	Progress
Confusion	Nothing
Suggestion	Add an option to create new study tasks.

Overall Feedback Summary

- Both participants were able to complete all four assigned tasks. Participant 1 experienced some difficulty understanding the purpose and working of the Study Partner feature, while Participant 2 completed all tasks without difficulty.
- Participant 1 also suggested improving the visual layout because it appeared slightly congested. Participant 2 suggested to add an option to create new study tasks.
- The feedback helped identify areas where the design could be improved, particularly the clarity of the Study Partner feature and the overall visual arrangement.

4. Key Findings and Analysis

The usability testing helped identify which parts of the Studli app were easy to use and which areas needed improvement. Both participants completed all four testing tasks successfully.

1. Easy-to-use Features

Both participants found the Plan Studies and Check Progress tasks easy. Returning to the Home screen was also easy for both participants. This indicates that the main navigation and these features were understandable.

2. Study Partner Feature

Participant 1 experienced some difficulty understanding the Study Partner feature. The issue was not finding the navigation option but understanding the purpose of the feature and how it works. Participant 2 completed this task easily. This showed that the feature needed a clearer explanation.

3. Visual Design

Participant 1 mentioned that the design looked slightly congested. This feedback highlighted the need to improve the visual layout and make the interface look more organised.

4. Additional Feature Suggestion

Participant 2 suggested adding an option to create new study tasks. This suggestion highlighted an opportunity to make the Planner more useful by providing a dedicated way to add tasks.

5. Overall Analysis

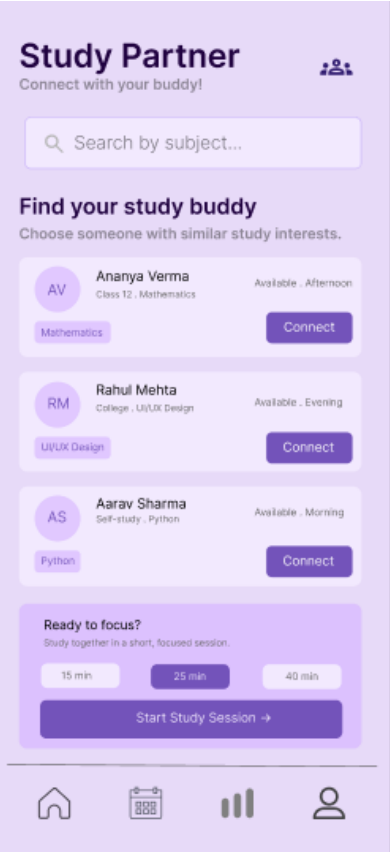

The results showed that the main features of Studli were generally easy to use. However, the feedback identified three areas for improvement: clarifying the Study Partner feature, reducing visual congestion, and adding an option to create new study tasks.

5. Design Improvements and Changes Made

Based on the feedback received during usability testing, improvements were made to the Studli app prototype.

1. Improved Study Partner Screen

Participant 1 found it difficult to understand the purpose of the Study Partner feature. To address this, the screen was updated to make its purpose and working process clearer. This helps users understand how the feature can be used to find a study partner.

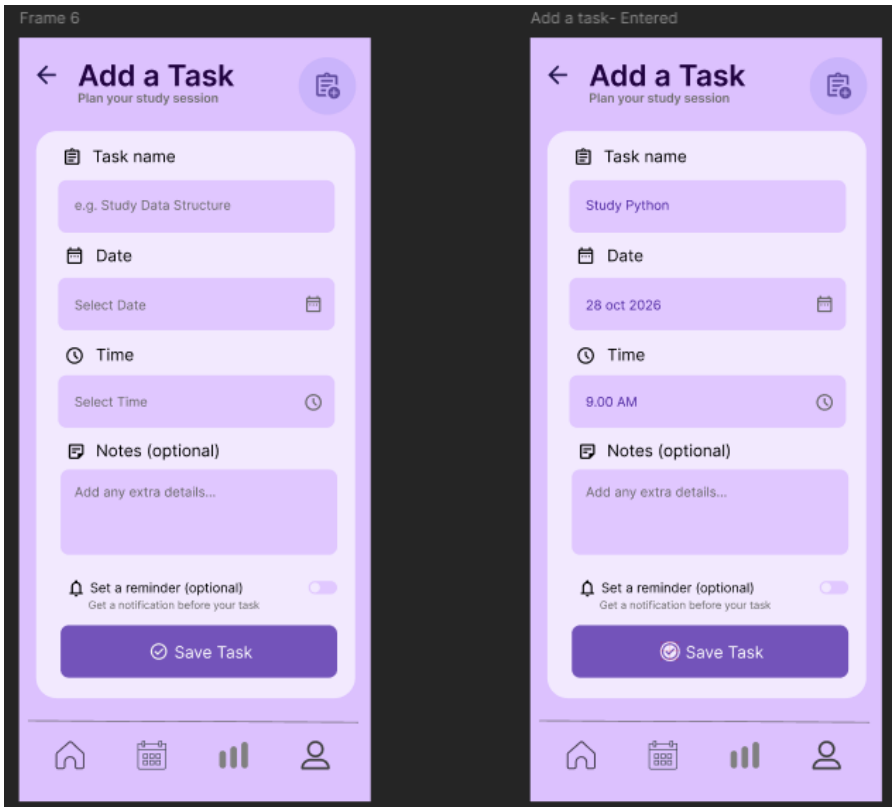

2. Reduced Visual Congestion

Participant 1 mentioned that the design looked slightly congested. Small layout adjustments were made to make the interface look cleaner and more organised.

3. Added an Add a Task Screen

The additional Add a Task screen was created based on Participant 2's suggestion. The updated prototype was reviewed after this addition, and the participants approved the changes.

4. Prototype Improvements

The prototype was reviewed after making the changes. Navigation links, screen connections, and interactive elements were checked to ensure that the app flow worked properly.

6. Retesting Results

After making the suggested design improvements, the updated Studli prototype was reviewed again by the participants. They approved the changes made to the design.

1. Study Partner Screen

The purpose and working process of the Study Partner feature were made clearer. The updated design was approved by the participants.

2. Visual Layout

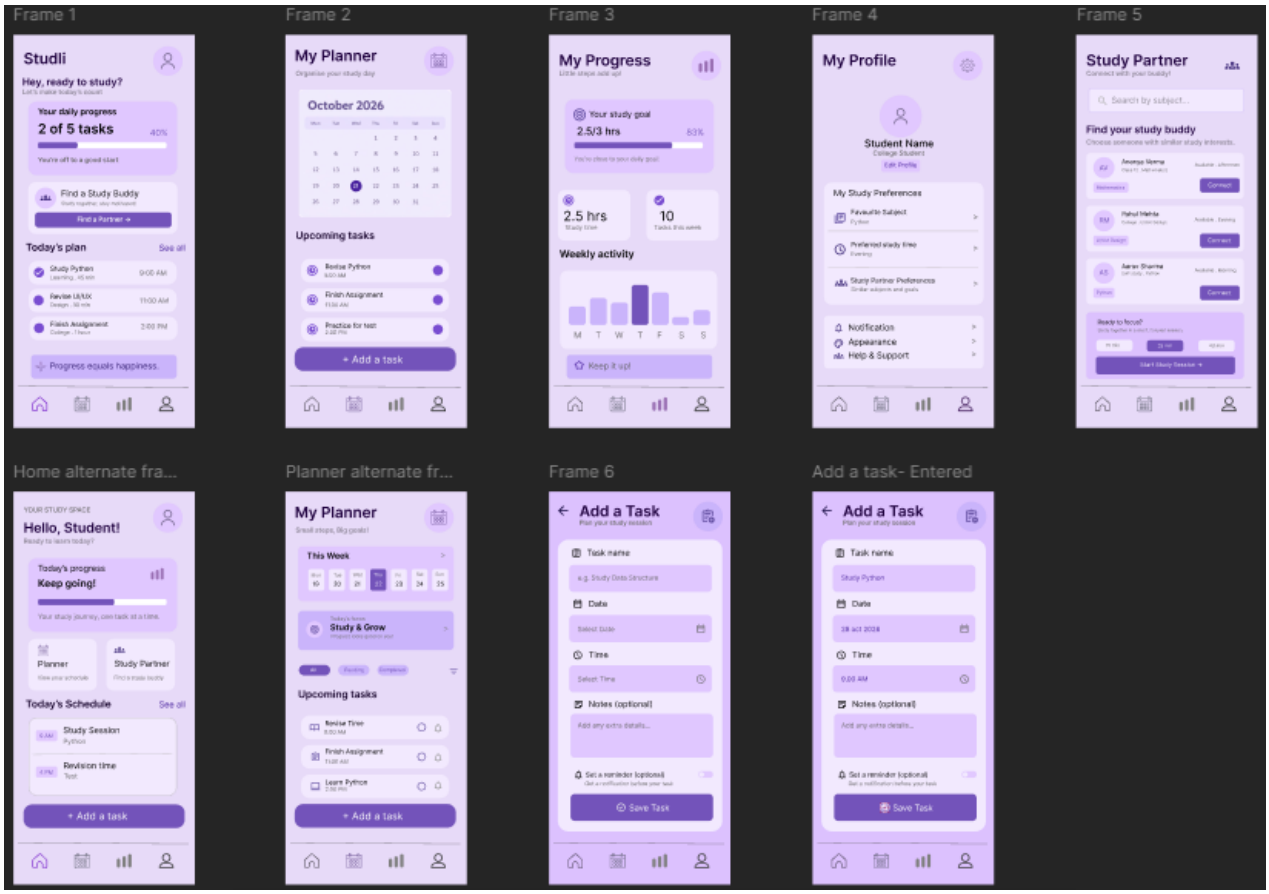

Small adjustments were made to reduce the congested appearance and make the interface more organised. The participants approved the updated design.

3. Add a Task Screen

The additional Add a Task screen was included in the updated prototype based on Participant 2's suggestion. The updated prototype was reviewed and approved by the participants.

4. Overall Feedback

The feedback received after the improvements was positive. The changes addressed the suggestions identified during the initial usability testing.

7. Conclusion

The usability testing of the Studli – Study Planner App helped evaluate how easily students could understand and use its main features. Two participants tested the prototype by completing four tasks related to planning studies, checking progress, finding a study partner, and returning to the Home screen.

The feedback showed that most features were easy to use, but some improvements were needed in the Study Partner screen and visual layout. Participant 2 also suggested adding an option to create new study tasks.

Based on these suggestions, the Study Partner screen was made clearer, minor visual adjustments were introduced, and an additional Add a Task screen was created. The updated prototype was reviewed again and approved by the participants.

Overall, this project provided practical experience in usability testing, collecting feedback, analysing user needs, and improving a UI/UX design based on user suggestions.
